

R E V I E W

A row of six light-colored wooden blocks, each with a black letter, spelling out the word "REVIEW". The blocks are arranged horizontally on a dark wooden surface. In the background, several other wooden blocks are visible, some with letters like 'M', 'I', 'E', 'N', '7', and 'C'. In the foreground, there are more wooden blocks, some of which are out of focus, including one with the letter 'I' and another with the number '22'.

Questions to prepare for the exam

Announcements

Midterm exam is on Thursday

- Bring a pen and a pencil
- One page (single sided) with code and equations only!
 - You will turn in this page of notes with your exam (put your name on it)
 - Recommend including equations for SEs, etc.

Office hours this week

- No TA office hours this week since there is no homework

Review of the grammar of graphics and ggplot

The grammar of graphics

Leland Wilkinson noticed similarities between many graphs and tried to generate a ‘grammar’ that could be used to express a graph

- i.e., a list elements that can be combined together to create a graph

Hadley Wickham implemented these ideas in R in the ggplot2 package

Graphs are composed of...

A Frame: Coordinate system on which data is placed

- `ggplot()` +

Glyphs: basic graphic unit representing cases or statistics

- Data is **mapped** onto these aesthetics such as: shape, color, size, etc. and/or aesthetics can be set to a fixed value
 - `geom_point(aes(x = gdpPercap, y = lifeExp, color = continent))` `geom_point(aes(x = gdpPercap, y = lifeExp), color = "red")`

Scales and guides: shows how to interpret axes and other properties of the glyphs

- `scale_x_continuous(trans = "log10")` `scale_color_brewer(type = "qua", palette = 2)`

Plots can also contain...

Facets: allows for multiple side-by-side graphs based on a categorical variable

- `facet_wrap(~country)`

Layers: allows for more than one types of data to be mapped onto the same figure

- `geom_vline(xintercept = 1969, col = "red")`

Theme: contains finer points of display (e.g., font size, background color, etc.)

- `theme_wsj()`

ggplot2 cheat sheet

Data visualization with ggplot2 :: CHEAT SHEET

Basics

ggplot2 is based on the **grammar of graphics**, the idea that you can build every graph from the same components: a **data** set, a **coordinate system**, and **geoms**—visual marks that represent data points.

To display values, map variables in the data to visual properties of the geom (**aesthetics**) like **size**, **color**, and **x** and **y** locations.

Complete the template below to build a graph.

```
ggplot(data = <DATA>) +  
  <GEOM_FUNCTION>(mapping = aes(<MAPPINGS>),  
    stat = <STAT>, position = <POSITION>) +  
  <COORDINATE_FUNCTION> +  
  <FACET_FUNCTION> +  
  <SCALE_FUNCTION> +  
  <THEME_FUNCTION>
```

required

Not required, sensible defaults supplied

ggplot(data = mpg, aes(x = cty, y = hwy)) Begins a plot that you finish by adding layers to. Add one geom function per layer.

last_plot() Returns the last plot.

ggsave("plot.png", width = 5, height = 5) Saves last plot as 5" x 5" file named "plot.png" in working directory. Matches file type to file extension.

Aes

Common aesthetic values.

color and **fill** - string ("red", "#RRGGBB")

linetype - integer or string (0 = "blank", 1 = "solid", 2 = "dashed", 3 = "dotted", 4 = "dotdash", 5 = "longdash", 6 = "twodash")

lineend - string ("round", "butt", or "square")

linejoin - string ("round", "mitre", or "bevel")

size - integer (line width in mm)

shape - integer/shape name or a single character ("a")

Geoms

Use a geom function to represent data points, use the geom's aesthetic properties to represent variables. Each function returns a layer.

GRAPHICAL PRIMITIVES

a <- ggplot(economics, aes(date, unemployment))

b <- ggplot(seals, aes(x = long, y = lat))

a + geom_blank() and **a + expand_limits()**
Ensure limits include values across all plots.

b + geom_curve(aes(yend = lat + 1, xend = long + 1), curvature = 1) - x, yend, y, yend, alpha, angle, color, curvature, linetype, size

a + geom_path(lineend = "butt", linejoin = "round", linemitre = 1) - x, y, alpha, color, group, linetype, size

a + geom_polygon(aes(alpha = 50)) - x, y, alpha, color, fill, group, subgroup, linetype, size

b + geom_rect(aes(xmin = long, ymin = lat, xmax = long + 1, ymax = lat + 1)) - xmax, xmin, ymax, ymin, alpha, color, fill, linetype, size

a + geom_ribbon(aes(ymin = unemployment - 900, ymax = unemployment + 900)) - x, ymax, ymin, alpha, color, fill, group, linetype, size

LINE SEGMENTS

common aesthetics: x, y, alpha, color, linetype, size

b + geom_abline(aes(intercept = 0, slope = 1))

b + geom_hline(aes(yintercept = lat))

b + geom_vline(aes(xintercept = long))

Probability and confidence intervals

Probability functions; e.g., `rnorm`, `pnorm`, `dnorm`, `qnorm`

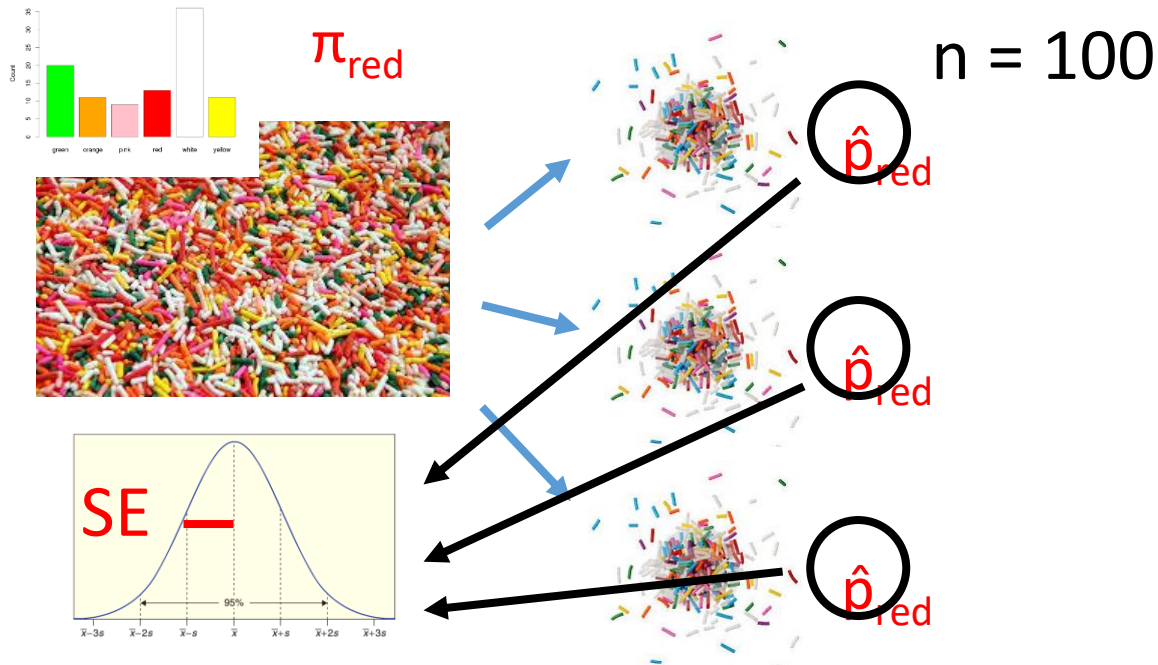

Confidence intervals:

$$CI_{95} = \text{stat} \pm 2 \cdot SE$$

Sampling and bootstrap distributions

Sampling distribution

Sampling distribution!

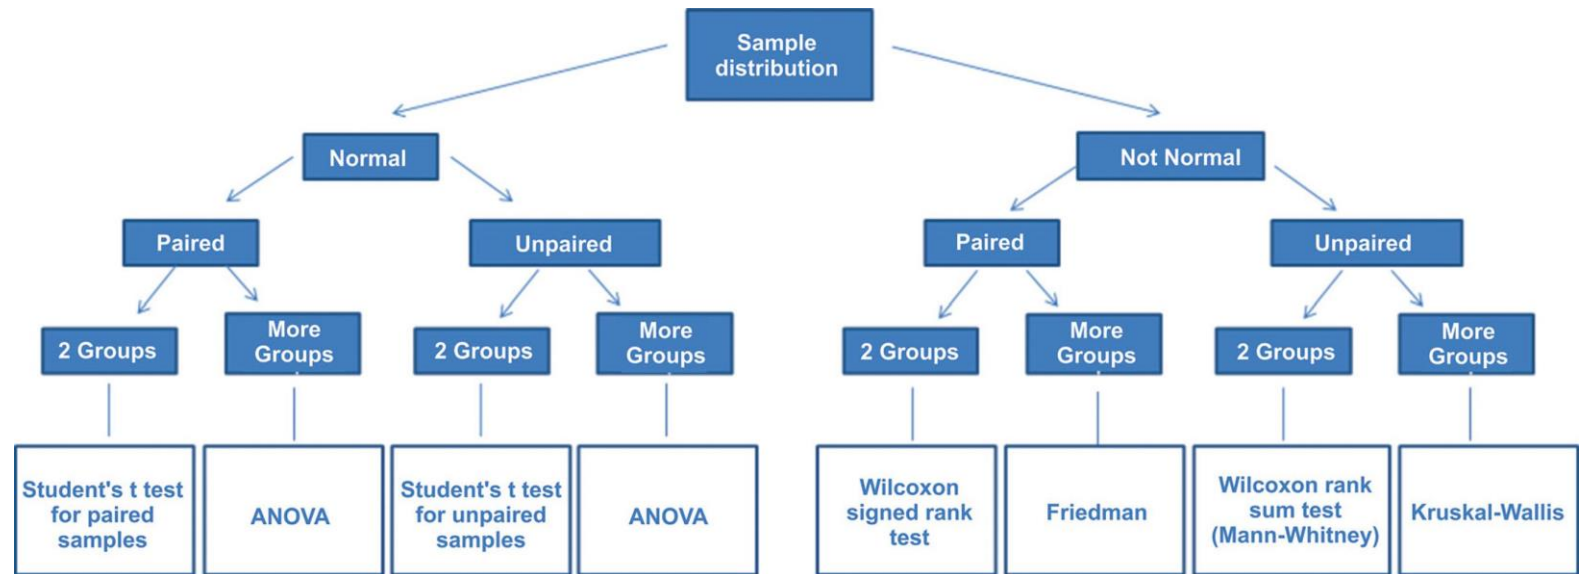

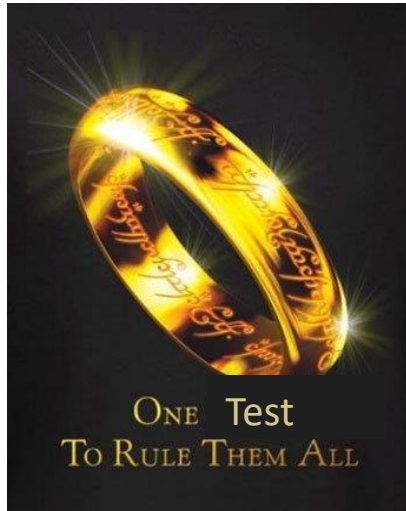

$$CI_{95} = \text{stat} \pm 2 \cdot SE^*$$

Bootstrap distribution

Sample with replacement from our original sample to mimic a sampling distribution

Hypothesis tests

Just need to follow 5 steps!

Randomization/permutation tests

Create a null distribution through computational simulations/shuffling

- `rbinom()`, `sample()`, etc.
